<p>The aim of this experiment was to use highthroughput chromatin immunoprecipitation followed by hybridization to promoter microarrays to obtain a comprehensive list of sites in the genome that are physically occupied by Pdx1. Chromatin was prepared from Min6 insulinoma cells and immunoprecipitated with Pdx1 or control antiserum. The precipitated chromatin was then purified, amplified and directly sequenced using Illumina technology.</p>

|Fold Change| Greater Than:

Confidence Level: High Confidence  All Results

*For a microarray experiment a result with high confidence has a confidence level of at least 80%.*

*For a ChIP-chip experiment a result with high confidence has a confidence level of at least 90% and all fold changes are positive.*

Reference (Denominator): IgG ChIP MIN6 cells
